Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

1.1 Description

RISC-V RV64GCB 64-bit processor model

1.2 Licensing

This Model is released under the Open Source Apache 2.0

1.3 Extensions

1.3.1 Extensions Enabled by Default

The model has the following architectural extensions enabled, and the corresponding bits in the misa CSR Extensions field will be set upon reset:

```
misa bit 0: extension A (atomic instructions)
```

misa bit 1: extension B (bit manipulation extension)

misa bit 2: extension C (compressed instructions)

misa bit 3: extension D (double-precision floating point)

misa bit 5: extension F (single-precision floating point)

misa bit 8: RV32I/RV64I/RV128I base integer instruction set

misa bit 12: extension M (integer multiply/divide instructions)

misa bit 18: extension S (Supervisor mode)

misa bit 20: extension U (User mode)

To specify features that can be dynamically enabled or disabled by writes to the misa register in addition to those listed above, use parameter "add_Extensions_mask". This is a string parameter containing the feature letters to add; for example, value "DV" indicates that double-precision floating point and the Vector Extension can be enabled or disabled by writes to the misa register, if supported on this variant. Parameter "sub_Extensions_mask" can be used to disable dynamic update of features in the same way.

Legacy parameter "misa_Extensions_mask" can also be used. This Uns32-valued parameter specifies all writable bits in the misa Extensions field, replacing any permitted bits defined in the base variant.

Note that any features that are indicated as present in the misa mask but absent in the misa will be ignored. See the next section.

1.3.2 Enabling Other Extensions

The following extensions are supported by the model, but not enabled by default in this variant:

misa bit 4: RV32E base integer instruction set (embedded)

misa bit 7: extension H (hypervisor)

misa bit 10: extension K (cryptographic)

misa bit 13: extension N (user-level interrupts)

misa bit 21: extension V (vector extension)

misa bit 23: extension X (non-standard extensions present)

To enable features from this list, use parameter "add_Extensions". This is a string containing identification letters of features to enable; for example, value "DV" indicates that double-precision

floating point and the Vector Extension should be enabled, if they are currently absent and are available on this variant.

Legacy parameter "misa_Extensions" can also be used. This Uns32-valued parameter specifies the reset value for the misa CSR Extensions field, replacing any permitted bits defined in the base variant.

1.3.3 Disabling Extensions

The following extensions are enabled by default in the model and can be disabled:

misa bit 0: extension A (atomic instructions)

misa bit 1: extension B (bit manipulation extension)

misa bit 2: extension C (compressed instructions)

misa bit 3: extension D (double-precision floating point)

misa bit 5: extension F (single-precision floating point)

misa bit 12: extension M (integer multiply/divide instructions)

misa bit 18: extension S (Supervisor mode)

misa bit 20: extension U (User mode)

To disable features that are enabled by default, use parameter "sub_Extensions". This is a string containing identification letters of features to disable; for example, value "DF" indicates that double-precision and single-precision floating point extensions should be disabled, if they are enabled by default on this variant.

1.4 General Features

1.4.1 mtvec CSR

On this variant, the Machine trap-vector base-address register (mtvec) is writable. It can instead be configured as read-only using parameter "mtvec_is_ro".

Values written to "mtvec" are masked using the value 0xfffffffffffff. A different mask of writable bits may be specified using parameter "mtvec_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec_align" defaults to 0, implying no alignment constraint.

If parameter "mtvec_sext" is True, values written to "mtvec" are sign-extended from the most-significant writable bit. In this variant, "mtvec_sext" is False, indicating that "mtvec" is not sign-extended.

The initial value of "mtvec" is 0x0. A different value may be specified using parameter "mtvec" if required.

1.4.2 styec CSR

Values written to "stvec" are masked using the value 0xfffffffffffff. A different mask of writable bits may be specified using parameter "stvec_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec_align" defaults to 0, implying no alignment constraint.

If parameter "stvec_sext" is True, values written to "stvec" are sign-extended from the most-significant writable bit. In this variant, "stvec_sext" is False, indicating that "stvec" is not sign-extended.

1.4.3 Reset

On reset, the model will restart at address 0x0. A different reset address may be specified using parameter "reset_address" or applied using optional input port "reset_addr" if required.

1.4.4 NMI

On an NMI, the model will restart at address 0x0; a different NMI address may be specified using parameter "nmi_address" or applied using optional input port "nmi_addr" if required. The cause reported on an NMI is 0x0 by default; a different cause may be specified using parameter "ecode_nmi" or applied using optional input port "nmi_cause" if required.

If parameter "rnmi_version" is not "none", resumable NMIs are supported, managed by additional CSRs "mnscratch", "mnepc", "mncause" and "mnstatus", following the indicated version of the Resumable NMI extension proposal. In this variant, "rnmi_version" is "none".

1.4.5 WFI

WFI will halt the processor until an interrupt occurs. It can instead be configured as a NOP using parameter "wfi_is_nop". WFI timeout wait is implemented with a time limit of 0 (i.e. WFI causes an Illegal Instruction trap in Supervisor mode when mstatus.TW=1).

1.4.6 cycle CSR

The "cycle" CSR is implemented in this variant. Set parameter "cycle_undefined" to True to instead specify that "cycle" is unimplemented and reads of it should trap to Machine mode.

1.4.7 time CSR

The "time" CSR is implemented in this variant. Set parameter "time_undefined" to True to instead specify that "time" is unimplemented and reads of it should trap to Machine mode. Usually, the value of the "time" CSR should be provided by the platform - see notes below about the artifact "CSR" bus for information about how this is done.

1.4.8 instret CSR

The "instret" CSR is implemented in this variant. Set parameter "instret_undefined" to True to instead specify that "instret" is unimplemented and reads of it should trap to Machine mode.

1.4.9 ASID

A 16-bit ASID is implemented. Use parameter "ASID_bits" to specify a different implemented ASID size if required.

This variant supports address translation modes 0, 8 and 9. Use parameter "Sv_modes" to specify a bit mask of different modes if required.

TLB behavior is controlled by parameter "ASIDCacheSize". If this parameter is 0, then an unlimited number of TLB entries will be maintained concurrently. If this parameter is non-zero, then only TLB entries for up to "ASIDCacheSize" different ASIDs will be maintained concurrently initially; as new ASIDs are used, TLB entries for less-recently used ASIDs are deleted, which improves model performance in some cases. If the model detects that the TLB entry cache is too small (entry ejections are very frequent), it will increase the cache size automatically. In this variant, "ASIDCacheSize" is 8

1.4.10 Unaligned Accesses

Unaligned memory accesses are not supported by this variant. Set parameter "unaligned" to "T" to enable such accesses.

Unaligned memory accesses are not supported for AMO instructions by this variant. Set parameter "unalignedAMO" to "T" to enable such accesses.

1.4.11 PMP

16 PMP entries are implemented by this variant. Use parameter "PMP_registers" to specify a different number of PMP entries; set the parameter to 0 to disable the PMP unit. The PMP grain size (G) is 0, meaning that PMP regions as small as 4 bytes are implemented. Use parameter "PMP_grain" to specify a different grain size if required. Unaligned PMP accesses are not decomposed into separate aligned accesses; use parameter "PMP_decompose" to modify this behavior if required.

1.4.12 LR/SC Granule

LR/SC instructions are implemented with a 1-byte reservation granule. A different granule size may be specified using parameter "lr_sc_grain".

1.4.13 Zicsr

Parameter "Zicsr" is 1 on this variant, meaning that standard CSRs and CSR access instructions are implemented. If CSRs are not implemented, an alternative scheme must be provided as a processor extension.

1.4.14 Zifencei

Parameter "Zifencei" is 1 on this variant, meaning that the fence instruction is implemented. If implemented, this instruction is treated as a NOP by the model.

1.5 Floating Point Features

The D extension is enabled in this variant independently of the F extension. Set parameter "d_requires_f" to "T" to specify that the D extension requires the F extension to be enabled.

Half precision floating point is not implemented. Use parameter "Zfh" to enable this if required.

By default, the processor starts with floating-point instructions disabled (mstatus.FS=0). Use parameter "mstatus.FS" to force mstatus.FS to a non-zero value for floating-point to be enabled from the start.

The specification is imprecise regarding the conditions under which mstatus.FS is set to Dirty state (3). Parameter "mstatus_fs_mode" can be used to specify the required behavior in this model, as described below.

If "mstatus_fs_mode" is set to "always_dirty" then the model implements a simplified floating point status view in which mstatus.FS holds values 0 (Off) and 3 (Dirty) only; any write of values 1 (Initial) or 2 (Clean) from privileged code behave as if value 3 was written.

If "mstatus_fs_mode" is set to "write_1" then mstatus.FS will be set to 3 (Dirty) by any explicit write to the fflags, frm or fcsr control registers, or by any executed instruction that writes an FPR, or by any executed floating point compare or conversion to integer/unsigned that signals a floating point exception. Floating point compare or conversion to integer/unsigned instructions that do not signal an exception will not set mstatus.FS.

If "mstatus_fs_mode" is set to "write_any" then mstatus.FS will be set to 3 (Dirty) by any explicit write to the fflags, frm or fcsr control registers, or by any executed instruction that writes an FPR, or by any executed floating point compare or conversion even if those instructions do not signal a floating point exception.

In this variant, "mstatus_fs_mode" is set to "write_1".

1.6 Bit-Manipulation Extension

This variant implements the Bit-Manipulation extension with version specified in the References section of this document. Note that parameter "bitmanip_version" can be used to select the re-

quired version of this extension. See section "Bit-Manipulation Extension Versions" for detailed information about differences between each supported version.

1.6.1 Bit-Manipulation Extension Parameters

Parameter Zbb is used to specify that the base instructions are present. By default, Zbb is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zba is used to specify that address calculation instructions are present. By default, Zba is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbc is used to specify that carryless operation instructions are present. By default, Zbc is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbe is used to specify that bit deposit/extract instructions are present. By default, Zbe is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbf is used to specify that bit field place instructions are present. By default, Zbf is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbm is used to specify that bit matrix operation instructions are present. By default, Zbm is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbp is used to specify that permutation instructions are present. By default, Zbp is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbr is used to specify that CRC32 instructions are present. By default, Zbr is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbs is used to specify that single bit instructions are present. By default, Zbs is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbt is used to specify that ternary instructions are present. By default, Zbt is set to 1 in this variant. Updates to this parameter require a commercial product license.

1.6.2 Bit-Manipulation Extension Versions

The Bit-Manipulation Extension specification has been under active development. To enable simulation of hardware that may be based on an older version of the specification, the model implements behavior for a number of previous versions of the specification. The differing features of these are listed below, in chronological order.

1.6.3 Version 0.90

Stable 0.90 version of June 10 2019.

1.6.4 Version 0.91

Stable 0.91 version of August 29 2019, with these changes compared to version 0.90:

- change encodings of bmatxor, grev, grevw, grevi and greviw;
- add gorc, gorcw, gorci, gorciw, bfp and bfpw instructions.

1.6.5 Version 0.92

Stable 0.92 version of November 8 2019, with these changes compared to version 0.91:

- add packh, packu and packuw instructions;
- add sext.b and sext.h instructions;
- change encoding and behavior of bfp and bfpw instructions;
- change encoding of bdep and bdepw instructions.

1.6.6 Version 0.93-draft

Draft 0.93 version of January 29 2020, with these changes compared to version 0.92:

- add sh1add, sh2add, sh3add, sh1addu, sh2addu and sh3addu instructions;
- move slo, sloi, sro and sroi to Zbp subset;
- add orc16 to Zbb subset.

1.6.7 Version 0.93

Stable 0.93 version of January 10 2021, with these changes compared to version 0.93-draft:

- assignments of instructions to Z extension groups changed;
- exchange encodings of max and minu instructions;
- add xperm.[nbhw] instructions;
- instructions named *u.w renamed to *.uw;
- instructions named sb* renamed to b*;
- instructions named pcnt* renamed to cpop*;
- instructions subu.w, addiwu, addwu, subwu, clmulw, clmulrw and clmulhw removed;
- instructions slo, sro, sloi, sroi, slow, srow, sloiw and sroiw removed from all Z extension groups and are therefore never implemented;
- instructions bext/bdep renamed to becompress/bdecompress (this change is documented under the draft 0.94 version but is required to resolve an instruction name conflict introduced by instruction renames above);

1.6.8 Version 0.94

Stable 0.94 version of January 20 2021, with these changes compared to version 0.93:

- instructions bset[i]w, bclr[i]w, binv[i]w and bextw removed.

1.6.9 Version 1.0.0

Stable 1.0.0 version of June 6 2021, with these changes compared to version 0.94:

- instructions with immediate shift operands now follow base architecture semantics to determine operand legality instead of masking to XLEN-1;
- only subsets Zba, Zbb, Zbc and Zbs may be enabled.

1.6.10 Version master

Unstable master version, currently identical to 1.0.0, except that any subset may be enabled.

1.7 CLIC

The model can be configured to implement a Core Local Interrupt Controller (CLIC) using parameter "CLICLEVELS"; when non-zero, the CLIC is present with the specified number of interrupt levels (2-256), as described in the RISC-V Core-Local Interrupt Controller specification, and further parameters are made available to configure other aspects of the CLIC. "CLICLEVELS" is zero in this variant, indicating that a CLIC is not implemented.

1.8 Load-Reserved/Store-Conditional Locking

By default, LR/SC locking is implemented automatically by the model and simulator, with a reservation granule defined by the "lr_sc_grain" parameter. It is also possible to implement locking externally to the model in a platform component, using the "LR_address", "SC_address" and "SC_valid" net ports, as described below.

The "LR_address" output net port is written by the model with the address used by a load-reserved instruction as it executes. This port should be connected as an input to the external lock management component, which should record the address, and also that an LR/SC transaction is active.

The "SC_address" output net port is written by the model with the address used by a store-conditional instruction as it executes. This should be connected as an input to the external lock management component, which should compare the address with the previously-recorded load-reserved address, and determine from this (and other implementation-specific constraints) whether the store should succeed. It should then immediately write the Boolean success/fail code to the "SC_valid" input net port of the model. Finally, it should update state to indicate that an LR/SC transaction is no longer active.

It is also possible to write zero to the "SC_valid" input net port at any time outside the context of a store-conditional instruction, which will mark any active LR/SC transaction as invalid.

Irrespective of whether LR/SC locking is implemented internally or externally, taking any exception or interrupt or executing exception-return instructions (e.g. MRET) will always mark any active LR/SC transaction as invalid.

1.9 Active Atomic Operation Indication

The "AMO_active" output net port is written by the model with a code indicating any current atomic memory operation while the instruction is active. The written codes are:

0: no atomic instruction active

- 1: AMOMIN active
- 2: AMOMAX active
- 3: AMOMINU active
- 4: AMOMAXU active
- 5: AMOADD active
- 6: AMOXOR active
- 7: AMOOR active
- 8: AMOAND active
- 9: AMOSWAP active
- 10: LR active
- 11: SC active

1.10 Interrupts

The "reset" port is an active-high reset input. The processor is halted when "reset" goes high and resumes execution from the reset address specified using the "reset_address" parameter or "reset_addr" port when the signal goes low. The "mcause" register is cleared to zero.

The "nmi" port is an active-high NMI input. The processor resumes execution from the address specified using the "nmi_address" parameter or "nmi_addr" port when the NMI signal goes high. The "mcause" register is cleared to zero.

All other interrupt ports are active high. For each implemented privileged execution level, there are by default input ports for software interrupt, timer interrupt and external interrupt; for example, for Machine mode, these are called "MSWInterrupt", "MTimerInterrupt" and "MExternalInterrupt", respectively. When the N extension is implemented, ports are also present for User mode. Parameter "unimp_int_mask" allows the default behavior to be changed to exclude certain interrupt ports. The parameter value is a mask in the same format as the "mip" CSR; any interrupt

corresponding to a non-zero bit in this mask will be removed from the processor and read as zero in "mip", "mie" and "mideleg" CSRs (and Supervisor and User mode equivalents if implemented).

Parameter "external_int_id" can be used to enable extra interrupt ID input ports on each hart. If the parameter is True then when an external interrupt is applied the value on the ID port is sampled and used to fill the Exception Code field in the "mcause" CSR (or the equivalent CSR for other execution levels). For Machine mode, the extra interrupt ID port is called "MExternalInterruptID".

The "deferint" port is an active-high artifact input that, when written to 1, prevents any pendingand-enabled interrupt being taken (normally, such an interrupt would be taken on the next instruction after it becomes pending-and-enabled). The purpose of this signal is to enable alignment with hardware models in step-and-compare usage.

1.11 Debug Mode

The model can be configured to implement Debug mode using parameter "debug_mode". This implements features described in Chapter 4 of the RISC-V External Debug Support specification with version specified by parameter "debug_version" (see References). Some aspects of this mode are not defined in the specification because they are implementation-specific; the model provides infrastructure to allow implementation of a Debug Module using a custom harness. Features added are described below.

Parameter "debug_mode" can be used to specify three different behaviors, as follows:

- 1. If set to value "vector", then operations that would cause entry to Debug mode result in the processor jumping to the address specified by the "debug_address" parameter. It will execute at this address, in Debug mode, until a "dret" instruction causes return to non-Debug mode. Any exception generated during this execution will cause a jump to the address specified by the "dexc_address" parameter.
- 2. If set to value "interrupt", then operations that would cause entry to Debug mode result in the processor simulation call (e.g. opProcessorSimulate) returning, with a stop reason of OP_SR_INTERRUPT. In this usage scenario, the Debug Module is implemented in the simulation harness.
- 3. If set to value "halt", then operations that would cause entry to Debug mode result in the processor halting. Depending on the simulation environment, this might cause a return from the simulation call with a stop reason of OP_SR_HALT, or debug mode might be implemented by another platform component which then restarts the debugged processor again.

1.11.1 Debug State Entry

The specification does not define how Debug mode is implemented. In this model, Debug mode is enabled by a Boolean pseudo-register, "DM". When "DM" is True, the processor is in Debug mode. When "DM" is False, mode is defined by "mstatus" in the usual way.

Entry to Debug mode can be performed in any of these ways:

1. By writing True to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of

at least one cycle (e.g. using opProcessorSimulate), dcsr cause will be reported as trigger;

- 2. By writing a 1 then 0 to net "haltreq" (using opNetWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 3. By writing a 1 to net "resethaltreq" (using opNetWrite) while the "reset" signal undergoes a negedge transition, followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 4. By executing an "ebreak" instruction when Debug mode entry for the current processor mode is enabled by dcsr.ebreakm, dcsr.ebreaks or dcsr.ebreaku.

In all cases, the processor will save required state in "dpc" and "dcsr" and then perform actions described above, depending in the value of the "debug_mode" parameter.

1.11.2 Debug State Exit

Exit from Debug mode can be performed in any of these ways:

- 1. By writing False to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 2. By executing an "dret" instruction when Debug mode.

In both cases, the processor will perform the steps described in section 4.6 (Resume) of the Debug specification.

1.11.3 Debug Registers

When Debug mode is enabled, registers "dcsr", "dpc", "dscratch0" and "dscratch1" are implemented as described in the specification. These may be manipulated externally by a Debug Module using opProcessorRegRead or opProcessorRegWrite; for example, the Debug Module could write "dcsr" to enable "ebreak" instruction behavior as described above, or read and write "dpc" to emulate stepping over an "ebreak" instruction prior to resumption from Debug mode.

1.11.4 Debug Mode Execution

The specification allows execution of code fragments in Debug mode. A Debug Module implementation can cause execution in Debug mode by the following steps:

- 1. Write the address of a Program Buffer to the program counter using opProcessorPCSet;
- 2. If "debug_mode" is set to "halt", write 0 to pseudo-register "DMStall" (to leave halted state);
- 3. If entry to Debug mode was handled by exiting the simulation callback, call opProcessorSimulate or opRootModuleSimulate to resume simulation.

Debug mode will be re-entered in these cases:

- 1. By execution of an "ebreak" instruction; or:
- 2. By execution of an instruction that causes an exception.

In both cases, the processor will either jump to the debug exception address, or return control immediately to the harness, with stopReason of OP_SR_INTERRUPT, or perform a halt, depending on the value of the "debug_mode" parameter.

1.11.5 Debug Single Step

When in Debug mode, the processor or harness can cause a single instruction to be executed on return from that mode by setting dcsr.step. After one non-Debug-mode instruction has been executed, control will be returned to the harness. The processor will remain in single-step mode until dcsr.step is cleared.

1.11.6 Debug Ports

Port "DM" is an output signal that indicates whether the processor is in Debug mode

Port "haltreq" is a rising-edge-triggered signal that triggers entry to Debug mode (see above).

Port "resethaltreq" is a level-sensitive signal that triggers entry to Debug mode after reset (see above).

1.12 Trigger Module

This model is configured with a trigger module, implementing a subset of the behavior described in Chapter 5 of the RISC-V External Debug Support specification with version specified by parameter "debug_version" (see References).

1.12.1 Trigger Module Restrictions

The model currently supports tdata1 of type 0, type 2 (mcontrol), type 3 (icount), type 4 (itrigger), type 5 (etrigger) and type 6 (mcontrol6). icount triggers are implemented for a single instruction only, with count hard-wired to 1 and automatic zeroing of mode bits when the trigger fires.

1.12.2 Trigger Module Parameters

Parameter "trigger_num" is used to specify the number of implemented triggers. In this variant, "trigger_num" is 4.

Parameter "tinfo" is used to specify the value of the read-only "tinfo" register, which indicates the trigger types supported. In this variant, "tinfo" is 0x7d.

Parameter "tinfo_undefined" is used to specify whether the "tinfo" register is undefined, in which case reads of it trap to Machine mode. In this variant, "tinfo_undefined" is 0.

Parameter "tcontrol_undefined" is used to specify whether the "tcontrol" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "tcontrol_undefined" is 0.

Parameter "mcontext_undefined" is used to specify whether the "mcontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mcontext_undefined" is 0.

Parameter "scontext_undefined" is used to specify whether the "scontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "scontext_undefined" is 0.

Parameter "mscontext_undefined" is used to specify whether the "mscontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mscontext_undefined" is 0.

Parameter "amo_trigger" is used to specify whether load/store triggers are activated for AMO instructions. In this variant, "amo_trigger" is 0.

Parameter "no_hit" is used to specify whether the "hit" bit in tdata1 is unimplemented. In this variant, "no_hit" is 0.

Parameter "no_sselect_2" is used to specify whether the "sselect" field in "textra32"/"textra64" registers is unable to hold value 2 (indicating match by ASID is not allowed). In this variant, "no_sselect_2" is 0.

Parameter "mcontext_bits" is used to specify the number of writable bits in the "mcontext" register. In this variant, "mcontext_bits" is 13.

Parameter "scontext_bits" is used to specify the number of writable bits in the "scontext" register. In this variant, "scontext_bits" is 34.

Parameter "mvalue_bits" is used to specify the number of writable bits in the "mvalue" field in "textra32"/"textra64" registers; if zero, the "mselect" field is tied to zero. In this variant, "mvalue_bits" is 13.

Parameter "svalue_bits" is used to specify the number of writable bits in the "svalue" field in "textra32"/"textra64" registers; if zero, the "sselect" is tied to zero. In this variant, "svalue_bits" is 34.

Parameter "mcontrol_maskmax" is used to specify the value of field "maskmax" in the "mcontrol" register. In this variant, "mcontrol_maskmax" is 63.

1.13 Debug Mask

It is possible to enable model debug messages in various categories. This can be done statically using the "override_debugMask" parameter, or dynamically using the "debugflags" command. Enabled messages are specified using a bitmask value, as follows:

Value 0x002: enable debugging of PMP and virtual memory state;

Value 0x004: enable debugging of interrupt state.

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

1.14 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

1.14.1 CSR Register External Implementation

If parameter "enable_CSR_bus" is True, an artifact 16-bit bus "CSR" is enabled. Slave callbacks installed on this bus can be used to implement modified CSR behavior (use opBusSlaveNew or icmMapExternalMemory, depending on the client API). A CSR with index 0xABC is mapped on the bus at address 0xABC0; as a concrete example, implementing CSR "time" (number 0xC01) externally requires installation of callbacks at address 0xC010 on the CSR bus.

1.14.2 LR/SC Active Address

Artifact register "LRSCAddress" shows the active LR/SC lock address. The register holds all-ones if there is no LR/SC operation active or if LR/SC locking is implemented externally as described above.

1.14.3 Page Table Walk Introspection

Artifact register "PTWStage" shows the active page table translation stage (0 if no stage active, 1 if HS-stage active, 2 if VS-stage active and 3 if G-stage active). This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

Artifact register "PTWInputAddr" shows the input address of active page table translation. This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

Artifact register "PTWLevel" shows the active level of page table translation (corresponding to index variable "i" in the algorithm described by Virtual Address Translation Process in the RISC-V Privileged Architecture specification). This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

1.14.4 Artifact Register "fflags_i"

If parameter "enable_fflags_i" is True, an 8-bit artifact register "fflags_i" is added to the model. This register shows the floating point flags set by the current instruction (unlike the standard "fflags" CSR, in which the flag bits are sticky).

1.15 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. fence.i) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous. Data barrier instructions (e.g. fence) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Hardware Performance Monitor registers are not implemented and hardwired to zero.

The TLB is architecturally-accurate but not device accurate. This means that all TLB maintenance and address translation operations are fully implemented but the cache is larger than in the real device.

1.16 Verification

All instructions have been extensively tested by Imperas, using tests generated specifically for this model and also reference tests from https://github.com/riscv/riscv-tests.

Also reference tests have been used from various sources including:

https://github.com/riscv/riscv-tests

https://github.com/ucb-bar/riscv-torture

The Imperas OVPsim RISC-V models are used in the RISC-V Foundation Compliance Framework as a functional Golden Reference:

https://github.com/riscv/riscv-compliance

where the simulated model is used to provide the reference signatures for compliance testing. The Imperas OVPsim RISC-V models are used as reference in both open source and commercial instruction stream test generators for hardware design verification, for example:

http://valtrix.in/sting from Valtrix

https://github.com/google/riscv-dv from Google

The Imperas OVPsim RISC-V models are also used by commercial and open source RISC-V Core RTL developers as a reference to ensure correct functionality of their IP.

1.17 References

The Model details are based upon the following specifications:

RISC-V Instruction Set Manual, Volume I: User-Level ISA (User Architecture Version 20190305-Base-Ratification)

RISC-V Instruction Set Manual, Volume II: Privileged Architecture (Privileged Architecture Version 20190405-Priv-MSU-Ratification)

RISC-V "B" Bit Manipulation Extension (Bit Manipulation Architecture Version v0.94-20210120)

Configuration

2.1 Location

This model's VLNV is riscv.ovpworld.org/processor/riscv/1.0.

The model source is usually at:

\$IMPERAS_HOME/ImperasLib/source/riscv.ovpworld.org/processor/riscv/1.0

The model binary is usually at:

\$IMPERAS_HOME/lib/\$IMPERAS_ARCH/ImperasLib/riscv.ovpworld.org/processor/riscv/1.0

2.2 GDB Path

The default GDB for this model is: \$IMPERAS_HOME/lib/\$IMPERAS_ARCH/gdb/riscv-none-embed-gdb.

2.3 Semi-Host Library

The default semi-host library file is riscv.ovpworld.org/semihosting/pk/1.0

2.4 Processor Endian-ness

This is a LITTLE endian model.

2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

2.6 Processor ELF code

The ELF code supported by this model is: 0xf3.

Boolean Specify that Zicsr is implemented	sub_Extensions_mask	String	Remove extensions specified by letters from mask of writable bits in
ZifenceiBooleanSpecify that Zifencei is implementedBit_ManipulationEnumerationSpecify required Bit Manipulation Architecture version (0.90, 0.91, 0.92, 0.93-draft, 0.93, 0.94, 1.0.0 or master)ZbaBooleanSpecify that Zba is implemented (bit manipulation extension)ZbbBooleanSpecify that Zbb is implemented (bit manipulation extension)ZbcBooleanSpecify that Zbc is implemented (bit manipulation extension)ZbfBooleanSpecify that Zbf is implemented (bit manipulation extension)ZbfBooleanSpecify that Zbf is implemented (bit manipulation extension)ZbmBooleanSpecify that Zbm is implemented (bit manipulation extension)ZbpBooleanSpecify that Zbp is implemented (bit manipulation extension)ZbrBooleanSpecify that Zbr is implemented (bit manipulation extension)ZbsBooleanSpecify that Zbr is implemented (bit manipulation extension)ZbtBooleanSpecify that Zbr is implemented (bit manipulation extension)DebugEnumerationSpecify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE)debug_modeEnumerationSpecify how Debug mode is implemented (none, vector, interrupt or halt)			misa.Extensions (for example, specify "VD" to remove V and D features)
Bit_Manipulation bitmanip_version Enumeration Specify required Bit Manipulation Architecture version (0.90, 0.91, 0.92, 0.93-draft, 0.93, 0.94, 1.0.0 or master) Zba Boolean Specify that Zba is implemented (bit manipulation extension) Zbc Boolean Specify that Zbb is implemented (bit manipulation extension) Zbe Boolean Specify that Zbc is implemented (bit manipulation extension) Zbe Boolean Specify that Zbc is implemented (bit manipulation extension) Zbf Boolean Specify that Zbf is implemented (bit manipulation extension) Zbm Boolean Specify that Zbm is implemented (bit manipulation extension) Zbp Boolean Specify that Zbp is implemented (bit manipulation extension) Zbr Boolean Specify that Zbp is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbs Boolean Specify that Zbr is implemented (bit manipulation extension) Zbs Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Doulean Specify that Zbr is implemented (bit manipulation extension)	Zicsr	Boolean	Specify that Zicsr is implemented
Enumeration Specify required Bit Manipulation Architecture version (0.90, 0.91, 0.92, 0.93-draft, 0.93, 0.94, 1.0.0 or master) Zba Boolean Specify that Zba is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbe Boolean Specify that Zbc is implemented (bit manipulation extension) Zbe Boolean Specify that Zbc is implemented (bit manipulation extension) Zbf Boolean Specify that Zbc is implemented (bit manipulation extension) Zbm Boolean Specify that Zbc is implemented (bit manipulation extension) Zbp Boolean Specify that Zbc is implemented (bit manipulation extension) Zbr Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbs Boolean Specify that Zbc is implemented (bit manipulation extension) Zbt Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extension) Zbc Boolean Specify that Zbc is implemented (bit manipulation extens	Zifencei	Boolean	Specify that Zifencei is implemented
Debug Debu	Bit_Manipulation		
Boolean Specify that Zba is implemented (bit manipulation extension) Boolean Specify that Zbb is implemented (bit manipulation extension) Boolean Specify that Zbc is implemented (bit manipulation extension) Boolean Specify that Zbc is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbm is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Bebug debug_version Enumeration Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)	bitmanip_version	Enumeration	Specify required Bit Manipulation Architecture version (0.90, 0.91, 0.92,
Boolean Specify that Zbb is implemented (bit manipulation extension) Boolean Specify that Zbc is implemented (bit manipulation extension) Boolean Specify that Zbc is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbm is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension) Specify that Zbf is implemented (bit manipulation extension) Boolean Specify that Zbf is implemented (bit manipulation extension)			0.93-draft, 0.93, 0.94, 1.0.0 or master)
Boolean Specify that Zbc is implemented (bit manipulation extension)	Zba	Boolean	Specify that Zba is implemented (bit manipulation extension)
Boolean Specify that Zbe is implemented (bit manipulation extension)	Zbb	Boolean	Specify that Zbb is implemented (bit manipulation extension)
Boolean Specify that Zbf is implemented (bit manipulation extension) Zbm Boolean Specify that Zbm is implemented (bit manipulation extension) Zbp Boolean Specify that Zbp is implemented (bit manipulation extension) Zbr Boolean Specify that Zbr is implemented (bit manipulation extension) Zbs Boolean Specify that Zbr is implemented (bit manipulation extension) Zbt Boolean Specify that Zbr is implemented (bit manipulation extension) Zbt Boolean Specify that Zbr is implemented (bit manipulation extension) Debug debug_version Enumeration Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)	Zbc	Boolean	Specify that Zbc is implemented (bit manipulation extension)
Boolean Specify that Zbm is implemented (bit manipulation extension)	Zbe	Boolean	Specify that Zbe is implemented (bit manipulation extension)
Boolean Specify that Zbp is implemented (bit manipulation extension) Boolean Specify that Zbr is implemented (bit manipulation extension) Boolean Specify that Zbr is implemented (bit manipulation extension) Boolean Specify that Zbs is implemented (bit manipulation extension) Boolean Specify that Zbt is implemented (bit manipulation extension) Debug debug_version Enumeration Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)	Zbf	Boolean	Specify that Zbf is implemented (bit manipulation extension)
Boolean Specify that Zbr is implemented (bit manipulation extension)	Zbm	Boolean	Specify that Zbm is implemented (bit manipulation extension)
Boolean Specify that Zbr is implemented (bit manipulation extension)	Zbp	Boolean	Specify that Zbp is implemented (bit manipulation extension)
Boolean Specify that Zbt is implemented (bit manipulation extension) Debug debug_version Enumeration Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)		Boolean	
Boolean Specify that Zbt is implemented (bit manipulation extension) Debug debug_version Enumeration Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)	Zbs	Boolean	Specify that Zbs is implemented (bit manipulation extension)
Debug Enumeration Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)	Zbt	Boolean	
debug_version Enumeration Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)	Debug		
DRAFT or 1.0.0-STABLE) debug_mode Enumeration Specify how Debug mode is implemented (none, vector, interrupt or halt)		Enumeration	Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-
	_		
	debug_mode	Enumeration	Specify how Debug mode is implemented (none, vector, interrupt or halt)
	Interrupts_Exceptions		

rnmi_version	Enumeration	Specify required RNMI Architecture version (none or 0.2.1)
mtvec_is_ro	Boolean	Specify whether mtvec CSR is read-only
tvec_align	Uns32	Specify whether interest is read-only Specify hardware-enforced alignment of mtvec/stvec/utvec when Vectored
tvec_angn	Ulis52	interrupt mode enabled
ecode_mask	Uns64	Specify hardware-enforced mask of writable bits in xcause.ExceptionCode
ecode_nmi	Uns64	Specify xcause.ExceptionCode for NMI
tval_zero	Boolean	Specify whether mtval/stval/utval are hard wired to zero
tval_zero_ebreak	Boolean	Specify whether mtval/stval/utval are set to zero by an ebreak
tval_ii_code	Boolean	Specify whether mtval/stval contain faulting instruction bits on illegal in-
what programmed in	Boolean	struction exception Whether an xRET instruction preserves the value of LR
xret_preserves_lr reset_address	Uns64	Override reset vector address
nmi_address	Uns64	Override reset vector address Override NMI vector address
local_int_num	Uns32	Specify number of supplemental local interrupts
unimp_int_mask	Uns64	Specify mask of unimplemented interrupts (e.g. 1<<9 indicates Supervisor
-		external interrupt unimplemented)
force_mideleg	Uns64	Specify mask of interrupts always delegated to lower-priority execution level from Machine execution level
force_sideleg	Uns64	Specify mask of interrupts always delegated to User execution level from Supervisor execution level
no_ideleg	Uns64	Specify mask of interrupts that cannot be delegated to lower-priority execution levels
no_edeleg	Uns64	Specify mask of exceptions that cannot be delegated to lower-priority execution levels
external_int_id	Boolean	Whether to add nets allowing External Interrupt ID codes to be forced
${f Floating_Point}$		
mstatus_fs_mode	Enumeration	Specify conditions causing update of mstatus.FS to dirty (write_1, write_any or always_dirty)
d_requires_f	Boolean	If D and F extensions are separately enabled in the misa CSR, whether D is enabled only if F is enabled
enable_fflags_i	Boolean	Whether fflags_i artifact register present (shows per-instruction floating point flags)
mstatus_FS	Uns32	Override default value of mstatus.FS (initial state of floating point unit)
Zfh	Boolean	Specify that Zfh is implemented (IEEE half-precision floating point is supported)
Zfinx_version	Enumeration	Specify that Zfinx is implemented (use integer register file for floating point instructions) (none, 0.4 or 0.41)
Simulation_Artifact		
ABI_d	Boolean	Specify whether D registers are used for parameters (ABI SemiHosting)
verbose	Boolean	Specify verbose output messages
traceVolatile	Boolean	Specify whether volatile registers (e.g. minstret) should be shown in change trace
enable_CSR_bus	Boolean	Add artifact CSR bus port, allowing CSR registers to be externally implemented
CSR_remap	String	Comma-separated list of CSR number mappings, each of the form <csr-name>=<number></number></csr-name>
ASID_cache_size	Uns32	Specifies the number of different ASIDs for which TLB entries are cached; a value of 0 implies no limit
Memory		*
updatePTEA	Boolean	Specify whether hardware update of PTE A bit is supported
updatePTED	Boolean	Specify whether hardware update of PTE D bit is supported
unaligned	Boolean	Specify whether the processor supports unaligned memory accesses
unalignedAMO	Boolean	Specify whether the processor supports unaligned memory accesses for AMO instructions
ASID_bits	Uns32	Specify the number of implemented ASID bits
lr_sc_grain	Uns32	Specify byte granularity of ll/sc lock region (constrained to a power of two)

PMP_grain	Uns32	Specify PMP region granularity, G (0 =>4 bytes, 1 =>8 bytes, etc)
PMP_registers	Uns32	Specify the number of implemented PMP address registers
PMP_max_page	Uns32	Specify the maximum size of PMP region to map if non-zero (may improve performance; constrained to a power of two)
PMP_decompose	Boolean	Whether unaligned PMP accesses are decomposed into separate aligned accesses
Sv_modes	Uns32	Specify bit mask of implemented Sv modes (e.g. 1<<8 is Sv39)
Instruction_CSR_Behavior	0 11502	specify of mask of implemented by modes (0.8. 1 < 0 is 5750)
wfi_is_nop	Boolean	Specify whether WFI should be treated as a NOP (if not, halt while waiting
WILLISITOP	Boolean	for interrupts)
counteren_mask	Uns32	Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers
noinhibit_mask	Uns32	Specify hardware-enforced mask of always-zero bits in mcountinhibit register
cycle_undefined	Boolean	Specify that the cycle CSR is undefined (reads to it are emulated by a Machine mode trap)
time_undefined	Boolean	Specify that the time CSR is undefined (reads to it are emulated by a Machine mode trap)
$instret_undefined$	Boolean	Specify that the instret CSR is undefined (reads to it are emulated by a Machine mode trap)
CSR_Masks		
mtvec_mask	Uns64	Specify hardware-enforced mask of writable bits in mtvec register
stvec_mask	Uns64	Specify hardware-enforced mask of writable bits in stvec register
mtvec_sext	Boolean	Specify whether mtvec is sign-extended from most-significant bit
stvec_sext	Boolean	Specify whether stvec is sign-extended from most-significant bit
MXL_writable	Boolean	Specify that misa.MXL is writable (feature under development)
SXL_writable	Boolean	Specify that mstatus.SXL is writable (feature under development)
UXL_writable	Boolean	Specify that mstatus.UXL is writable (feature under development)
Trigger		
tinfo_undefined	Boolean	Specify that the tinfo CSR is undefined
tcontrol_undefined	Boolean	Specify that the tcontrol CSR is undefined
mcontext_undefined	Boolean	Specify that the moontext CSR is undefined
scontext_undefined	Boolean	Specify that the scontext CSR is undefined
$mscontext_undefined$	Boolean	Specify that the mscontext CSR is undefined (Debug Version 0.14.0 and later)
amo_trigger	Boolean	Specify whether AMO load/store operations activate triggers
no_hit	Boolean	Specify that tdata1.hit is unimplemented
no_sselect_2	Boolean	Specify that textra.sselect=2 is not supported (no trigger match by ASID)
trigger_num	Uns32	Specify the number of implemented hardware triggers
tinfo	Uns32	Override tinfo register (for all triggers)
mcontext_bits	Uns32	Specify the number of implemented bits in mcontext
scontext_bits	Uns32	Specify the number of implemented bits in scontext
mvalue_bits	Uns32	Specify the number of implemented bits in textra.mvalue (if zero, textra.mselect is tied to zero)
svalue_bits	Uns32	Specify the number of implemented bits in textra.svalue (if zero, textra.sselect is tied to zero)
mcontrol_maskmax	Uns32	Specify mcontrol.maskmax value
CSR_Defauts	0 11502	Specify incontrol maskinax variety
mvendorid	Uns64	Override mvendorid register
marchid	Uns64	Override mrchid register Override marchid register
mimpid	Uns64	Override marcind register Override mimpid register
mhartid	Uns64	Override immipid register Override mhartid register (or first mhartid of an incrementing sequence if
mmar ord	0 11504	this is an SMP variant)
mtvec	Uns64	Override mtvec register
Fast_Interrupt	0.1100.1	5
CLICLEVELS	Uns32	Specify number of interrupt levels implemented by CLIC, or 0 if CLIC absent
	J 110.J2	The state of the s

Table 8.1: Parameters that can be set in: Hart

8.1 Parameters with enumerated types

8.1.1 Parameter user_version

Set to this value	Description
2.2	User Architecture Version 2.2
2.3	Deprecated and equivalent to 20190305
20190305	User Architecture Version 20190305-Base-Ratification

Table 8.2: Values for Parameter user_version

8.1.2 Parameter priv_version

Set to this value	Description		
1.10	Privileged Architecture Version 1.10		
1.11	Deprecated and equivalent to 20190405		
20190405	Privileged Architecture Version 20190405-Priv-MSU-Ratification		
master	Privileged Architecture Master Branch (1.12 draft)		

Table 8.3: Values for Parameter priv_version

8.1.3 Parameter bitmanip_version

Set to this value	Description		
0.90	Bit Manipulation Architecture Version v0.90-20190610		
0.91	Bit Manipulation Architecture Version v0.91-20190829		
0.92	Bit Manipulation Architecture Version v0.92-20191108		
0.93-draft	Bit Manipulation Architecture Version 0.93-draft-20200129		
0.93	Bit Manipulation Architecture Version v0.93-20210110		
0.94	Bit Manipulation Architecture Version v0.94-20210120		
1.0.0	Bit Manipulation Architecture Version 1.0.0		
master	Bit Manipulation Master Branch as of commit c1bd8ee (this is subject to change)		

Table 8.4: Values for Parameter bitmanip_version

8.1.4 Parameter debug_version

Set to this value	Description
0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT
0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT
1.0.0-STABLE	RISC-V External Debug Support Version 1.0.0-STABLE

Table 8.5: Values for Parameter debug_version

8.1.5 Parameter rnmi_version

Set to this value	Description
none	RNMI not implemented
0.2.1	RNMI version 0.2.1

Table 8.6: Values for Parameter rnmi_version

8.1.6 Parameter mstatus_fs_mode

Set to this value	Description
write_1	Any non-zero flag result sets mstatus.fs dirty
write_any	Any write of flags sets mstatus.fs dirty
always_dirty	mstatus.fs is either off or dirty

Table 8.7: Values for Parameter mstatus_fs_mode

8.1.7 Parameter debug_mode

Set to this value	Description
none	Debug mode not implemented
vector	Debug mode implemented by execution at vector
interrupt	Debug mode implemented by interrupt
halt	Debug mode implemented by halt

Table 8.8: Values for Parameter debug_mode

8.1.8 Parameter Zfinx_version

Set to this value	Description
none	Zfinx not implemented
0.4	Zfinx version 0.4
0.41	Zfinx version 0.41

Table 8.9: Values for Parameter Zfinx_version

Execution Modes

Mode	Code	Description
User	0	User mode
Supervisor	1	Supervisor mode
Machine	3	Machine mode

Table 9.1: Modes implemented in: Hart

Exceptions

Exception	Code	Description
InstructionAddressMisaligned	0	Fetch from unaligned address
InstructionAccessFault	1	No access permission for fetch
IllegalInstruction	2	Undecoded, unimplemented or disabled instruc-
		tion
Breakpoint	3	EBREAK instruction executed
LoadAddressMisaligned	4	Load from unaligned address
LoadAccessFault	5	No access permission for load
StoreAMOAddressMisaligned	6	Store/atomic memory operation at unaligned
		address
StoreAMOAccessFault	7	No access permission for store/atomic memory
		operation
EnvironmentCallFromUMode	8	ECALL instruction executed in User mode
EnvironmentCallFromSMode	9	ECALL instruction executed in Supervisor
		mode
EnvironmentCallFromMMode	11	ECALL instruction executed in Machine mode
InstructionPageFault	12	Page fault at fetch address
LoadPageFault	13	Page fault at load address
StoreAMOPageFault	15	Page fault at store/atomic memory operation
		address
SSWInterrupt	65	Supervisor software interrupt
MSWInterrupt	67	Machine software interrupt
STimerInterrupt	69	Supervisor timer interrupt
MTimerInterrupt	71	Machine timer interrupt
SExternalInterrupt	73	Supervisor external interrupt
MExternalInterrupt	75	Machine external interrupt

Table 10.1: Exceptions implemented in: Hart

Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

11.1 Level 1: Hart

This level in the model hierarchy has 5 commands.

This level in the model hierarchy has 6 register groups:

Group name	Registers
Core	33
Floating_point	32
User_Control_and_Status	35
Supervisor_Control_and_Status	12
Machine_Control_and_Status	102
Integration_support	5

Table 11.1: Register groups

This level in the model hierarchy has no children.

Model Commands

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

12.1 Level 1: Hart

12.1.1 dumpTLB

12.1.1.1 Argument description

show TLB contents

12.1.2 getCSRIndex

Return index for a named CSR (or -1 if no matching CSR)

Argument	Type	Description
-name	String	CSR name

Table 12.1: getCSRIndex command arguments

12.1.3 isync

specify instruction address range for synchronous execution

Argument	Type	Description
-addresshi	Uns64	end address of synchronous execution range
-addresslo	Uns64	start address of synchronous execution range

Table 12.2: isync command arguments

12.1.4 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing

-instructioncount	Boolean	include the instruction number in each trace
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 12.3: itrace command arguments

12.1.5 listCSRs

12.1.5.1 Argument description

List all CSRs in index order

hpmcounter31	64	0	r-	Performance Monitor Counter 31

Table 13.3: Registers at level 1, type:Hart group:User_Control_and_Status

$13.1.4 \quad Supervisor_Control_and_Status$

Registers at level:1, type:Hart group:Supervisor_Control_and_Status

Name	Bits	Initial-Hex	RW	Description	
sstatus	64	2 00000000	rw	Supervisor Status	
sie	64	0	rw	Supervisor Interrupt Enable	
stvec	64	0	rw	Supervisor Trap-Vector Base-Address	
scounteren	64	0	rw	Supervisor Counter Enable	
sscratch	64	0	rw	Supervisor Scratch	
sepc	64	0	rw	Supervisor Exception Program Counter	
scause	64	0	rw	Supervisor Cause	
stval	64	0	rw	Supervisor Trap Value	
sip	64	0	rw	Supervisor Interrupt Pending	
satp	64	0	rw	Supervisor Address Translation and Protection	
scontext	64	0	rw	Trigger Supervisor Context	
mscontext	64	0	rw	Trigger Machine Context Alias	

Table 13.4: Registers at level 1, type:Hart group:Supervisor_Control_and_Status

13.1.5 Machine_Control_and_Status

Registers at level:1, type:Hart group:Machine_Control_and_Status

Name	Bits	Initial-Hex	RW	Description
mstatus	64	a 00000000	rw	Machine Status
misa	64	80000000	rw	ISA and Extensions
		0014112f		
medeleg	64	0	rw	Machine Exception Delegation
mideleg	64	0	rw	Machine Interrupt Delegation
mie	64	0	rw	Machine Interrupt Enable
mtvec	64	0	rw	Machine Trap-Vector Base-Address
mcounteren	64	0	rw	Machine Counter Enable
mcountinhibit	64	0	rw	Machine Counter Inhibit
mhpmevent3	64	0	rw	Machine Performance Monitor Event Select 3
mhpmevent4	64	0	rw	Machine Performance Monitor Event Select 4
mhpmevent5	64	0	rw	Machine Performance Monitor Event Select 5
mhpmevent6	64	0	rw	Machine Performance Monitor Event Select 6
mhpmevent7	64	0	rw	Machine Performance Monitor Event Select 7
mhpmevent8	64	0	rw	Machine Performance Monitor Event Select 8
mhpmevent9	64	0	rw	Machine Performance Monitor Event Select 9
mhpmevent10	64	0	rw	Machine Performance Monitor Event Select 10
mhpmevent11	64	0	rw	Machine Performance Monitor Event Select 11
mhpmevent12	64	0	rw	Machine Performance Monitor Event Select 12
mhpmevent13	64	0	rw	Machine Performance Monitor Event Select 13
mhpmevent14	64	0	rw	Machine Performance Monitor Event Select 14
mhpmevent15	64	0	rw	Machine Performance Monitor Event Select 15
mhpmevent16	64	0	rw	Machine Performance Monitor Event Select 16
mhpmevent17	64	0	rw	Machine Performance Monitor Event Select 17
mhpmevent18	64	0	rw	Machine Performance Monitor Event Select 18
mhpmevent19	64	0	rw	Machine Performance Monitor Event Select 19
mhpmevent20	64	0	rw	Machine Performance Monitor Event Select 20
mhpmevent21	64	0	rw	Machine Performance Monitor Event Select 21
mhpmevent22	64	0	rw	Machine Performance Monitor Event Select 22
mhpmevent23	64	0	rw	Machine Performance Monitor Event Select 23
mhpmevent24	64	0	rw	Machine Performance Monitor Event Select 24
mhpmevent25	64	0	rw	Machine Performance Monitor Event Select 25
mhpmevent26	64	0	rw	Machine Performance Monitor Event Select 26
mhpmevent27	64	0	rw	Machine Performance Monitor Event Select 27
mhpmevent28	64	0	rw	Machine Performance Monitor Event Select 28
mhpmevent29	64	0	rw	Machine Performance Monitor Event Select 29
mhpmevent30	64	0	rw	Machine Performance Monitor Event Select 30
mhpmevent31	64	0	rw	Machine Performance Monitor Event Select 31
mscratch	64	0	rw	Machine Scratch
mepc	64	0	rw	Machine Exception Program Counter
mcause	64	0	rw	Machine Cause
mtval	64	0	rw	Machine Trap Value
mip	64	0	rw	Machine Interrupt Pending

Table 13.5: Registers at level 1, type:Hart group:Machine_Control_and_Status

13.1.6 Integration_support

Registers at level:1, type:Hart group:Integration_support

Name	Bits	Initial-Hex	RW	Description
------	------	-------------	----	-------------

LRSCAddress	64	THTTT THTTT	rw	LR/SC active lock address
commercial	8	0	r-	Commercial feature in use
PTWStage	8	0	r-	PTW active stage (0:none 1:HS 2:VS 3:G)
PTWInputAddr	64	0	r-	PTW input address
PTWLevel	8	0	r-	PTW active level
